Supporting Sustainable Fisheries through Increased Catfish Production

Catfish is one of the economically important freshwater fish in Indonesia, including in the South Sumatra region. The demand for fresh catfish continues to increase from year to year so that the increase in catfish production is also expected to increase. This can be done through aquaculture activities. Aquaculture developed with sustainable and responsible principles is one of the strategies in implementing the blue economy. Sustainable aquaculture is an aquaculture effort to increase fish production by preserving the environment. In an effort to support the increase in catfish production, Universitas Sriwijaya (UNSRI) Service Team has conducted activities involving local communities in the use of supplements to increase catfish production. This activity was carried out to educate residents around the UNSRI Campus about increasing production through sustainable catfish farming techniques.
