SDG 14 – Indicator 14.3.3 - Maintain ecosystems and their biodiversity (direct work)

Mangrove Restoration in South Sumatra

South Sumatra is one of the provinces that has extensive mangroves, which is about 28% of the total mangrove area on the island of Sumatra. With such a large area, mangrove conservation efforts in coastal South Sumatra are important, plus there is still 26,720 hectares of restoration potential. This is because mangrove forests are increasingly threatened by land conversion, especially for land clearing for settlements and ponds. To support efforts to preserve mangroves, Sriwijaya University (UNSRI) has been involved in activities related to mangrove ecosystems, such as mangrove restoration design plans and mangrove working group action plans in collaboration with the South Sumatra Provincial Forestry Service.
