Life Below Water

14.5 Maintaining a local ecosystem

SDG 14 – Indicator 14.5.2 - Monitoring the health of aquatic ecosystems

Monitoring of the Coral Reef Ecosystem in Enggano Sea

The coral reef ecosystem is a very important ecosystem for marine environments. Coral reefs provide a habitat for fish and other marine life, so it is crucial to maintain the health of the coral reefs. The Enggano Sea is one of the aquatic areas located off the coast of Sumatra Island. To assess the quality of the coral reefs in the Enggano Sea, the Universitas Sriwijaya (UNSRI) team conducted an observation of the coral reefs in 2023. The monitoring report indicated that the coral reef ecosystem in the Enggano Sea is in good condition and well-preserved. The seagrass beds in the area are also in good condition.
