UNSRI Holds a General Lecture on Marine Pollution

Marine pollution is one of the problems caused by human activities both in the water and on land. Indonesia, as an archipelagic country, has a vast marine area, and many people depend on the sea for their livelihood. Therefore, it is crucial to protect the sea from various types of pollution to ensure that marine resources remain available. One way to prevent marine pollution is by raising public awareness about the negative impacts of pollution. This can be done, for example, by holding public lectures and inviting experts in the field of marine pollution. In support of this, Universitas Sriwijaya (UNSRI) organized a public lecture on the theme "Microplastics in the Marine Environment: Current Conditions, Assessment Methodology, Impacts, and Solutions." Through this public lecture, it is hoped that the participants will better understand the importance of protecting the sea, especially from plastic pollution.
